**NEW ENERGY MANAGEMENT PORTAL LAUNCHES AS A
BETTER MEANS TO MEASURE CONTROL ENERGY EXPENSES**

HOUSTON (April 20, 2007) – With the possibility of a federal carbon “tax” in the near future and with rising energy costs creating an increased focus on energy conservation, LEGACY Energy Management Solutions, a Houston-based energy management and advisory firm, has launched a proprietary web-based energy portal, LEGACY PowerViews™, so its clients can better understand, measure, control and monitor consumption and demand trends from the meter level across the entire enterprise.

“LEGACY’s PowerViews™ analyzes and puts energy information at our client’s fingertips 24-7 in a user-friendly format,” said John Elder, president and chief executive officer of LEGACY. “With the looming possibility of future regulations of emissions, it is increasingly important to be fully informed on energy levels of consumption and demand in order to build an energy history and provide a valid benchmark.”

The proprietary portal is completely customizable and allows clients to determine the most important energy information they need to manage consumption, demand and expenditures, all while being supported by a team of experts to ensure updated and accurate energy data.

Unlike some retail energy providers that allow their customers to see only their energy bills for a limited period of time, LEGACY’s new offering provides a behind-the-scenes look at

LEGACY ENERGY MANAGEMENT PORTAL.../add 2

how a customer's electricity and natural gas usage and expenses affect multiple locations in aggregate as well as at each individual meter, regardless of the energy provider. The PowerViews™ portal also features the ability to measure the effect of energy conservation efforts as well as adjust historical consumption levels to account for weather and other operational considerations, allowing for a normalized view of energy consumption over time.

“When combined with LEGACY's statistical energy price forecasting, PowerViews™ is a valuable tool for our clients in the planning, valuation and implementation of energy savings projects,” said Elisa Kaplan, director of energy services for LEGACY. “This technology, backed by our experts who understand both demand-side and risk management, is crucial to giving our customers the control they need to understand and manage gas and electricity expenses.”
